## 4 General Description

The AH3517 is an analog signal output Hall IC, the output voltage changes with the changes of magnetic field. It has built-in circuit units such as reverse voltage protector, voltage regulator, temperature compensation circuit, Hall voltage generator, signal amplifier, etc. The high performance voltage regulator and temperature compensation circuit ensure that the sensor operates steadily over a wide range of voltages, and the reverse voltage protection circuit prevents the sensor from being damaged by the reverse voltage.

The AH3517 is produced with BCD technology. It is available in two package types: SOT-23-3L (Type M) and TO-92UA (Type UA). Each package is lead (Pb) free, with 100% matte tin plated leadframes.

## 9 Magnetic Behavior

### Vo raises with increasing B (S pole)

The sensor will pass linear area /nonlinear area/ saturation area during the magnetic induction increases. When there is no magnetic field that applies in sensor ( $B=0$ ), the output voltage of sensor is only half of  $V_{cc}$  ( $V_{cc}/2$ ); when N pole faces mark surface of the sensor and is close to it gradually ( $B \rightarrow -\infty$ ), the output voltage begins to decrease, and the voltage doesn't reduce with the increased magnetic field after it reaches saturation voltage; When the S pole of magnet faces the mark surface of the sensor and is closed to it gradually ( $B \rightarrow +\infty$ ), the output voltage of sensor begins to increase, and it doesn't increase with the increased magnetic field after it reaches saturation voltage. The magnetolectric conversion characteristics of AH3517 are shown in the figure:
