4 General Description

The AH3041N is a digital bipolar-latch Hall IC with single output. It has good temperature stability and latch function.

The AH3041N Hall-effect sensor includes the following on a single silicon chip: reverse voltage protector, voltage regulator, temperature compensation circuit, Hall-voltage generator, signal amplifier, Schmitt trigger and open collector output driver, etc. The integrated voltage regulator and temperature compensation circuit ensure that the sensor works stably in a wide voltage and temperature range. The reverse voltage protection circuit prevents the sensor from being damaged by reverse voltage.

The AH3041N, produced with bipolar technology, is more stable and reliable in some special application. It is available in three package types: SOT-23-3L (Type M), SOT-89 (Type S), and TO-92UA (Type UA). Each package is lead (Pb) free, with 100% matte tin plated leadframes.

10 Magnetic Behavior

South Pole Active

When the S pole of the magnet faces the mark surface of the sensor and is close to it ($B \geq B_{OP}$), the sensor outputs a low level; when the N pole faces the mark surface and is close to it ($B \leq B_{RP}$), the sensor outputs a high level. When the magnet is far away from the sensor ($B=0$), the output status of the sensor is latched and remains unchanged. In order to change the output status, the applied magnetic field must be opposite polarity.

North Pole Active

When the N pole of the magnet faces the mark surface of the sensor and is close to it ($|B| \geq |B_{OP}|$), the sensor outputs a low level; when the S pole faces the mark surface and is close to it ($|B| \geq |B_{RP}|$), the sensor outputs a high level. When the magnet is far away from the sensor ($B=0$), the output status of the sensor is latched and remains unchanged. In order to change the output status, the applied magnetic field must be opposite polarity. The magneto-electric conversion characteristics of AH3041N are shown in the figure:
